

## BOS1921 Development Kit

### 1 Features

- Plug and play development kit to experience piezoelectric actuator button and haptic feedback.
- Low-power BOS1921 integrated circuit, high voltage driver with I3C/I2C digital interface.
- Power supply via the USB port.
- Graphical user interface for ease of use.
- Standard USB audio to prototype haptic effects in MATLAB®, Python®, Audacity® and many other softwares<sup>1</sup>.
- Easy generation of high-voltage waveforms up to 190 Vpp.
- Two channel outputs for interchangeable miniature PCBs with BOS1921 drivers for prototyping.

Figure 1: BOS1921-KIT overview

### 2 Description

The BOS1921-KIT is a development kit to get familiar with the BOS1921 Piezo Haptic Driver IC.

The USB-powered kit appears as an USB Audio device for the computer, which allows quick and easy generation of waveforms using existing audio software like Audacity® for haptic prototyping.

The firmware supports autonomous operation for easy integration into development prototypes.

The interchangeable miniature PCBs give access to all signals allowing the users to experiment with the BOS1921 using a development platform of their choice.

Most commercial piezo actuators can be used with this kit. Capacitor loads are also provided to test output capabilities.

Table 1: Product information

PART NUMBER	DESCRIPTION
<b>BOS1921-KIT-B01</b>	Starter Set: includes a haptic and a micropump driver boards, and 4 load capacitors.

For details see sections 3 and 12.

<sup>1</sup> MATLAB® is registered trademark of The MathWorks, Inc.  
Python® is a registered trademark of the PSF

Audacity® is a registered trademark of Dominic Mazzoni

### 3 What's in the Box

The BOS1921-KIT is currently available in one package: *Starter Set*. The following table shows the content of the BOS1921-KIT *Starter Set*

Table 2: *Starter Set BOS1921-KIT-B01 development kit content*

#	ITEM	QTY	DESCRIPTION	REFERENCE
1	Controller Board	1	BOS1921-BRD-C02 Controller Board	
2	Driver Board Haptic	1	BOS1921-BRD-L02 Driver Board optimized for larger loads such as haptic.	
3	Driver Board Pump	1	BOS1921-BRD-S02 Driver Board optimized for smaller loads such as micropumps.	
4	USB-C Cable	1	Cable to connect the evaluation PCB to a computer Adafruit Industries LLC part number 4473	
5	Capacitor	1	10 nF film capacitor Panasonic ECQ-E2103JB	
6	Capacitor	1	47 nF film capacitor Panasonic ECQ-E2473JB3	
7	Capacitor	1	100 nF film capacitor Panasonic ECQ-E2104JB3	
8	Capacitor	1	470 nF film capacitor Panasonic ECQ-E2474JB	
9	3-position terminal block connector	1	Male connector used for interfacing the piezoelectric actuator on the board.	

#	ITEM	QTY	DESCRIPTION	REFERENCE
			Metz Connect part number 31369103, Molex part number 395100003 or equivalent.

11	6-position thru-hole header connector	1	2.54 mm pitch header connector for connection to external system (J3 connector on PCB). Würth Elektronik part number 61300611021 (6-pin) or equivalent.	

### 4 Board Overview

The purpose of this section is to show the location of the components that allow you to interact with the BOS1921-KIT board. This section is in a way the definition of the user interface provided by the development board. The focus is on buttons and LEDs which allow you to know and modify the current operating state.

Figure 2: BOS1921-KIT board user interface

Table 3: BOS1921-KIT board user interface

Components	Name	Description
A	USB connector	Supply power and provides connectivity with the GUI.
B	Operation mode LED	Flashing if alive and color shows the current operation mode.
C	Devkit error LED	Flashing if an error is detected on any component of the devkit
D	Reset button	Reset the micro-controller on press.
E	Change operation mode button	Change the current operation mode on press.
F	GPIO to trigger haptic feedback	If configured as a haptic trigger event, a rising edge on that GPIO will trigger a haptic feedback on a piezo actuator.
G	BOS1921 A/B status LED	LEDs displaying the current state of the BOS1921.
H	BOS1921 A/B board interface	Interface connector between controller and driver boards.
I	BOS1921 A/B terminal block	Terminals where piezoelectric actuator are connected.

### 4.1 Operation Mode LED Details

This section describes the meaning of the different colors and state transitions of the operation mode LED.

Table 4: Operation mode LED detail

Pattern	Color	Description
1 second on, 1 second off	Green	In <i>Haptic mode</i> and working normally.
1 second on, 1 second off	Blue	In <i>Audio mode</i> and working normally.
1 second on, 1 second off	Purple	In <i>Flash mode</i> and working normally (Operation mode not documented)

Any other pattern or color behavior maybe caused by unofficial firmware or bug.

### 4.2 BOS1921 Status LED Details

This section describes the meaning of the different colors and state transitions of the BOS1921 LED. The two BOS1921 of the BOS1921-KIT board are monitored to validate the presence of an internal error. If an error is detected, the BOS1921 Error LED is used to indicate the detection of this error.

Table 5: BOS1921 error LED details

Pattern	Color	Description
Always off	N/A	No error detected on any BOS1921.
Always on	Red	At least one internal error has been detected by a BOS1921.
Always on	Green	IC operate as button and the button is in released state. When the led turn off, the button is in pressed state.
Always on	Blue	When the LED is blue, the microcontroller requested a haptic feedback to the BOS1921.

## 5 Quick-Start

The BOS1921 and a piezoelectric actuator can be used together to implement the equivalent of a button. Before being shipped, the BOS1921-KIT board is set up in this button mode, so that you can experience it without additional extensive configuration or software installation. If you have an actuator such as TDK 1204, you can use it directly. Otherwise, the capacitors included in the kit can be used to test the BOS1921-KIT.

1. Open the box, take the BOS1921-KIT board, the USB cable, the small driver boards, the terminals block plugs, and either a piezo actuator or a capacitor.
2. Insert one or both the driver boards into the controller board.
3. Insert the terminal block plugs into the driver board(s) terminal block.
4. Using a small slotted screwdriver, install a piezoactuator on the terminal block plugs. **Pay attention to connect the positive wire on the OUT+ terminal and the negative wire on the OUT- terminal.** Refer to Figure 2 to identify location of OUT+ and OUT- on the terminal block.
5. Connect the development kit board to a USB port using the USB cable.
6. When the operation mode green LED is blinking and BOS1921 A/B status LED are solid green, you are ready to go.
7. If using a piezo actuator : press on the piezo actuation to experience the piezo actuator button.
  - a. If using a capacitor: either press the USER button on the board to set the board to *Audio* mode and use an audio software to play waveforms, or install the Haptic Studio software to interact with the board.

## 6 Get Started

The purpose of this section is to give instructions on where to get the latest versions of Boréas software and firmware. Keeping the software up to date ensures the latest features available are taken advantage of.

### 6.1 Creating a Boréas Account

Relevant documentation and software are available in the support section of Boréas website. Here are the instructions for accessing it:

- 1) Go to <https://www.boreas.ca/account>.
- 2) Click on “Create account”.
- 3) Enter the requested information.
- 4) Click on “Create Account”.

### 6.2 Identifying the BOS1921-KIT Board and BOM Revision

Each PCB board reference design (“REF:”) and revision (BT###-DK-v#. #) numbers are printed on the board silkscreen. A printed label stuck on the back of the PCB provides the board part number (P/N), containing the BOM revision suffix “-Bx”), and the assembly code (“#####AA”). The table below indicates compatibility with the firmware and Devkit Controller software.

Figure 3: Label example giving board part number with BOM revision suffix, and assembly code

Table 6: BOS1921-KIT board and software compatibility list

BOARD P/N*	PCB REFERENCE	COMPATIBLE FIRMWARE	COMPATIBLE PC SOFTWARE
BOS1921-BRD-C01-B1	PCB-0222 BT015-DK-UC-V1.0	BOARD_PCB_222_B1_DEVKIT-{VERSION}.hex Version starting at 1.15.x	Boreas-Dev-Kit Starting at 2.13.x
BOS1921-BRD-C02-B1	PCB-0305 BT015-DK-UC-V2.0	BoreasDevKit_Release_PCB0305_{VERSION}.hex Versions starting at 1.20.0	Haptic Studio Starting at 1.1.x

\* Board P/N include BOM revision suffix

Any PCB reference design number not listed into Table 6 are considered obsolete. The relevant documentation and software for obsolete products are still available into the archive section of our web site.

### 6.3 Download Boréas Haptic Studio Application

Haptic Studio software is a desktop application intended to ease evaluation of the BOS1921. This application can be downloaded from Boréas website. Help instructions are provided inside the application.

- 1) Log in your Boréas account.
- 2) Go to the "Technical Documents" section.
- 3) Click on the "BOS1921-KIT Documents" link.
- 4) Scroll down to section BOS1921-KIT Controller (PC software).
- 5) Download the appropriate Haptic Studio version based on your development kit identification.
- 6) Double click on the installer executable you downloaded and follow the instructions.

### 6.4 Upgrade Development Kit Firmware

The native BOS1921-KIT board firmware includes an over-USB firmware upgrade mechanism. The BOS1921-KIT Haptic Studio software will offer to upgrade the firmware if needed on next connection with the development kit. Follow the on-screen instructions.

For installation of firmware without the use of this application, refer to Appendix A.

## 7 Product Overview

The BOS1921-KIT has been designed to meet a multitude of needs. The main objective is to demonstrate the capacity of the BOS1921 but also to help integrators in the development of haptic effects and in its product prototyping.

**The BOS1921-KIT is delivered with a graphical user interface (GUI) for ease of use but it is not required to operate.** It can save and restore its configuration at start-up. We will refer to operation without the GUI by saying that the development board is used autonomously. It is configured in one of these autonomous mode before shipping (see section 5). We will explain in more detail the so-called autonomous modes in this document.

**The BOS1921-KIT supports multiple operation modes:**

*Table 7: Operation mode list*

Mode	Will help you to
<i>Haptic</i>	<ul style="list-style-type: none"> <li>• Experience piezo haptic button emulation.</li> <li>• Experiment with simple waveforms on various piezoelectric actuators.</li> <li>• Experiment with piezoelectric device sensing.</li> <li>• Evaluate any piezoelectric actuator for your application.</li> <li>• Evaluate BOS1921 performance (waveform output, power consumption) in the context of your application.</li> <li>• Optimize BOS1921 operation using specific registers value.</li> <li>• Command BOS1921-KIT waveform trigger from your system using an external trigger signal.</li> </ul>
<i>Audio</i>	<ul style="list-style-type: none"> <li>• Easily experiment with various waveform shapes and amplitudes.</li> <li>• Easily produce and compare various waveforms and identify the effects most suited for your application.</li> </ul>

**In *Haptic mode*, the Haptic Studios allows you to fire a given waveform from a variety of trigger mechanisms.**

The BOS1921-KIT is used to test the capacity of the BOS1921 with various piezoelectric actuators. The trigger events that can be used are an action *Play* in the application, or an action of pressing and releasing the piezoelectric actuator.

**In *Audio mode*, the development kit is detected as a standard stereo USB audio device by the PC.**

We know that our customers require more flexibility and control over the waveform used for their haptic effects. For these reasons, we put at your disposal the audio mode which allows you to have complete control over the wave transmitted to the BOS1921 via the USB port. Your PC can select the BOS1921-KIT as an audio card stereo output.

**The BOS1921-KIT development kit can be used as a basis for the development of a prototype.**

It is possible to connect an external I2C or I3C master without separating the mini-boards from the BOS1921-KIT. For more details about the hardware refers to section 8.

## 7.1 Audio Mode Operation

When the BOS1921-KIT board is in *Audio* mode, it is detected by Windows as a speaker device. When this device is selected, all audio output from the PC will be sent to the board. Make sure to deselect the Boreas DevKit to avoid the PC from playing system sounds on the actuator.

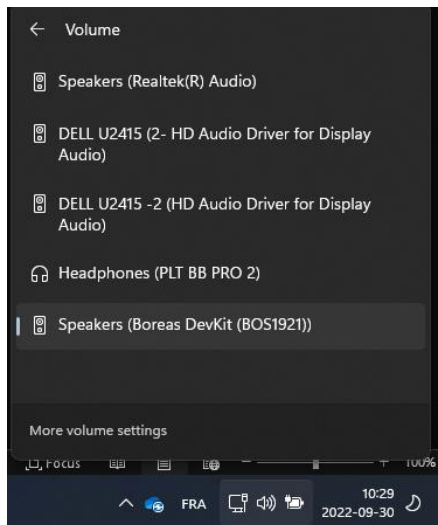

Figure 4: Boreas DevKit speaker

User should use a software that can specifically select an individual USB device as audio output. For example, Audacity® allows to easily create and play waveforms on the piezo actuators attached to the board. See appendix for more details.

Board channel A will play the left audio track, and board channel B plays the right channel track.

The audio level to BOS1921-KIT output voltage level is converted linearly so the maximum audio level corresponds to 95 V on the BOS1921-KIT output, 0 audio level corresponds to 0 V output, and polarity is maintained.

## 8.2 Hardware Features

In this section, we will discuss the various hardware configurations. Except for section 8.2.1, it is assumed that the driver boards are inserted into the controller board.

Some functionality in this section requires modifications to the PCB and requires a soldering iron. Disconnect the supply before making any changes to the board.

### 8.2.1 Interchangeable Driver Boards

**The use of the separable driver board units with custom-made firmware is done at the user's own risk of causing damage beyond repair to the BOS1921 circuit. Boréas Technologies will not be held responsible.**

One way to integrate a BOS1921 into your development platform is to directly connect to its header pin connector (left-hand side).

Figure 6: Driver boards

Each driver board contains a BOS1921 that can be used alone with a user-preferred development platform. All signals need to be connected to your development platform.

Table 8: Breakable Driver Section signals

Signal	Description	Constraint
VBUS	Main power supply for the BOS1921	Supply voltage between 3.0 V and 5.5 V with at least 500 mA current drive. When using the H board, use jumper J2 if using non-UPI configuration. Remove the jumper if using the UPI configuration.
GND	0 V reference	
SCL	I2C Clock signal	
SDA	I2C Data signal	
GPIO	Digital input/output	
SYNC	Synchronization pin	Used to synchronize feedback on many drivers boards.
VDDIO	Digital IO power supply	Digital signals voltage domain. Must be between 1.62 V and 5.5 V.

Refer to BOS1921 datasheet for a complete description on how to use and program the circuit.

## 8.2.2 Probe Hooks

Probe hooks are available around the board to ease connection of instruments for measurement of supplies when debugging. At the interface between the controller board and the driver boards lies a header pins connector. This connector allows to probe supply levels and digital signals.

Figure 7: Probe hook location

### 8.2.3 Digital GPIOs

General-purpose inputs and outputs (GPIOs) are provided to ease integration of the development kit in a prototype. For example, digital inputs may be used as trigger inputs to fire the waveforms or to send information from the system to the development kit. Four pins can be configured as input or output.

Using these GPIOs implies to modify the firmware to support them. However, they are already physically implemented and routed to the MCU. They need to be activated in the firmware software code project.

Figure 8: GPIOs and GPIOs supply voltage configuration solder bridge location

By default, the GPIOs are in the microcontroller 3.3 V supply domain. To use these GPIOs with a system operating in another voltage domain requires modification of the BOS1921-KIT PCB configuration.

Table 9: GPIOs supply voltage solder bridge configuration

GPIOs Supply Source	SB1 State
+3.3V (MCU supply)	Populated
VIO (1.62 V to 5.5 V)	Unpopulated

When SB1 is unpopulated, GPIOs supply voltage is provided by VIO and GND of the J3 connector. This J3 header connector is provided in the box but is not initially populated. Refer to the board schematics in section 9.1 for MCU pins numbers corresponding to IO0, IO0, IO2 and IO3.

### 8.2.4 External I2C

The BOS1921 features an I2C communication interface. By default, each BOS1921 are connected to the MCU I2C master. It is possible to bypass the MCU and use an external I2C master without separating the board. This can be useful when trying to connect a BOS1921 directly to an external system.

Figure 9: Comm selection switch and SPI header location

To use an external I2C, it is mandatory to enable it using the COMM Select switch on the board by setting it to EXT position. USB port must still be connected since it supplies the digital switches. When changing the position of COMM Select switch, the board must be power cycled (disconnect the USB cable and then reconnect it).

By default, the I2C signals are in the microcontroller 3.3 V supply domain. To use these signals with a system operating in another voltage domain requires modification of the BOS1921-KIT PCB configuration.

Table 10: SPIs supply voltage solder bridge configuration

I2C Supply Source	SB2 State
+3.3V (MCU supply)	Populated
VDDIO (1.62 V to 5.5 V)	Unpopulated

When SB2 is unpopulated, I2C supply voltage is provided by VDDIO and GND of the external I2C header connectors.

The H driver board supports both the UPI and non UPI configuration (see product datasheet for details). To use the non UPI mode, connect the J2 jumper, shorting VBUS and VDD. To use the UPI configuration, remove the jumper. UPI mode is disabled by default.

Figure 11: Driver board UPI mode configuration jumper location

Table 11: Power supply source and UPI mode configuration options

Supply Source	UPI Mode	Controller Board J4	Driver Board J2
USB 5V	Disable (non UPI)	Populated	Populated
USB 5V	Enable (UPI)	Populated	Unpopulated
External Supply	Disable (non UPI)	External	Populated
External Supply	Enable (UPI)	External	Unpopulated

Refer to the board schematics in section 9.1 to obtain more information regarding the power supply options. Refer to the BOS1921 datasheet to get more information regarding the UPI mode.

## 8.2.6 Piezo Actuator Low-Pass Filter

Two 0603 resistors ROx are in series with each BOS1921 output channels OUTx. They can be used to create a low-pass filter with the actuator and filter out audible noise. Resistor values to use are determined by the desired cut-off frequency and the actuator capacitance. A bode plot is useful to assess the amplitude attenuation at the waveform frequency in order to compensate it in the programmed voltage waveform. Initially, the populated values are 0 ohm. When adding such resistors, it is recommended to also increase CHV capacitance value.

Figure 12: Low-pass filter resistors location

### 8.2.7 Reconfiguring the PS Board

By default, the PS board is populated to output a unipolar output waveform of amplitude slightly lower than the peak-to-peak programmed waveform (the waveform is shifted upward). Therefore, a programmed continuous  $\pm 95$  V waveform will translate to a 0 to 180 V unipolar waveform on the actuator.

To change the board so the output is directly the programmed waveform (for example, a bipolar  $\pm 95$  V waveform), make the following changes to the board (see schematic in section 9.3):

- Remove CS1, CS2, D1 and Rf+.
- Add a 0-ohm resistor on either CS1 or CS2 landing (green).
- Add a 0-ohm resistor on Rf+ (green).
- Do not repopulate the other landings (red).

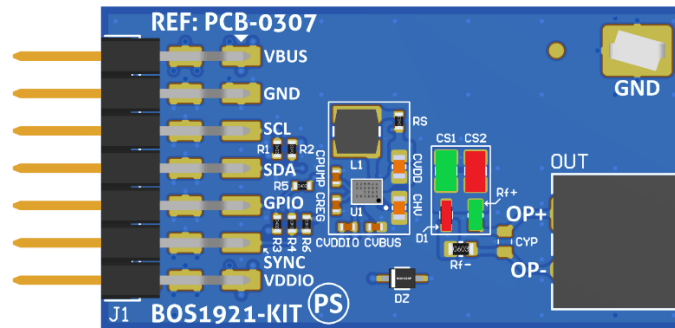

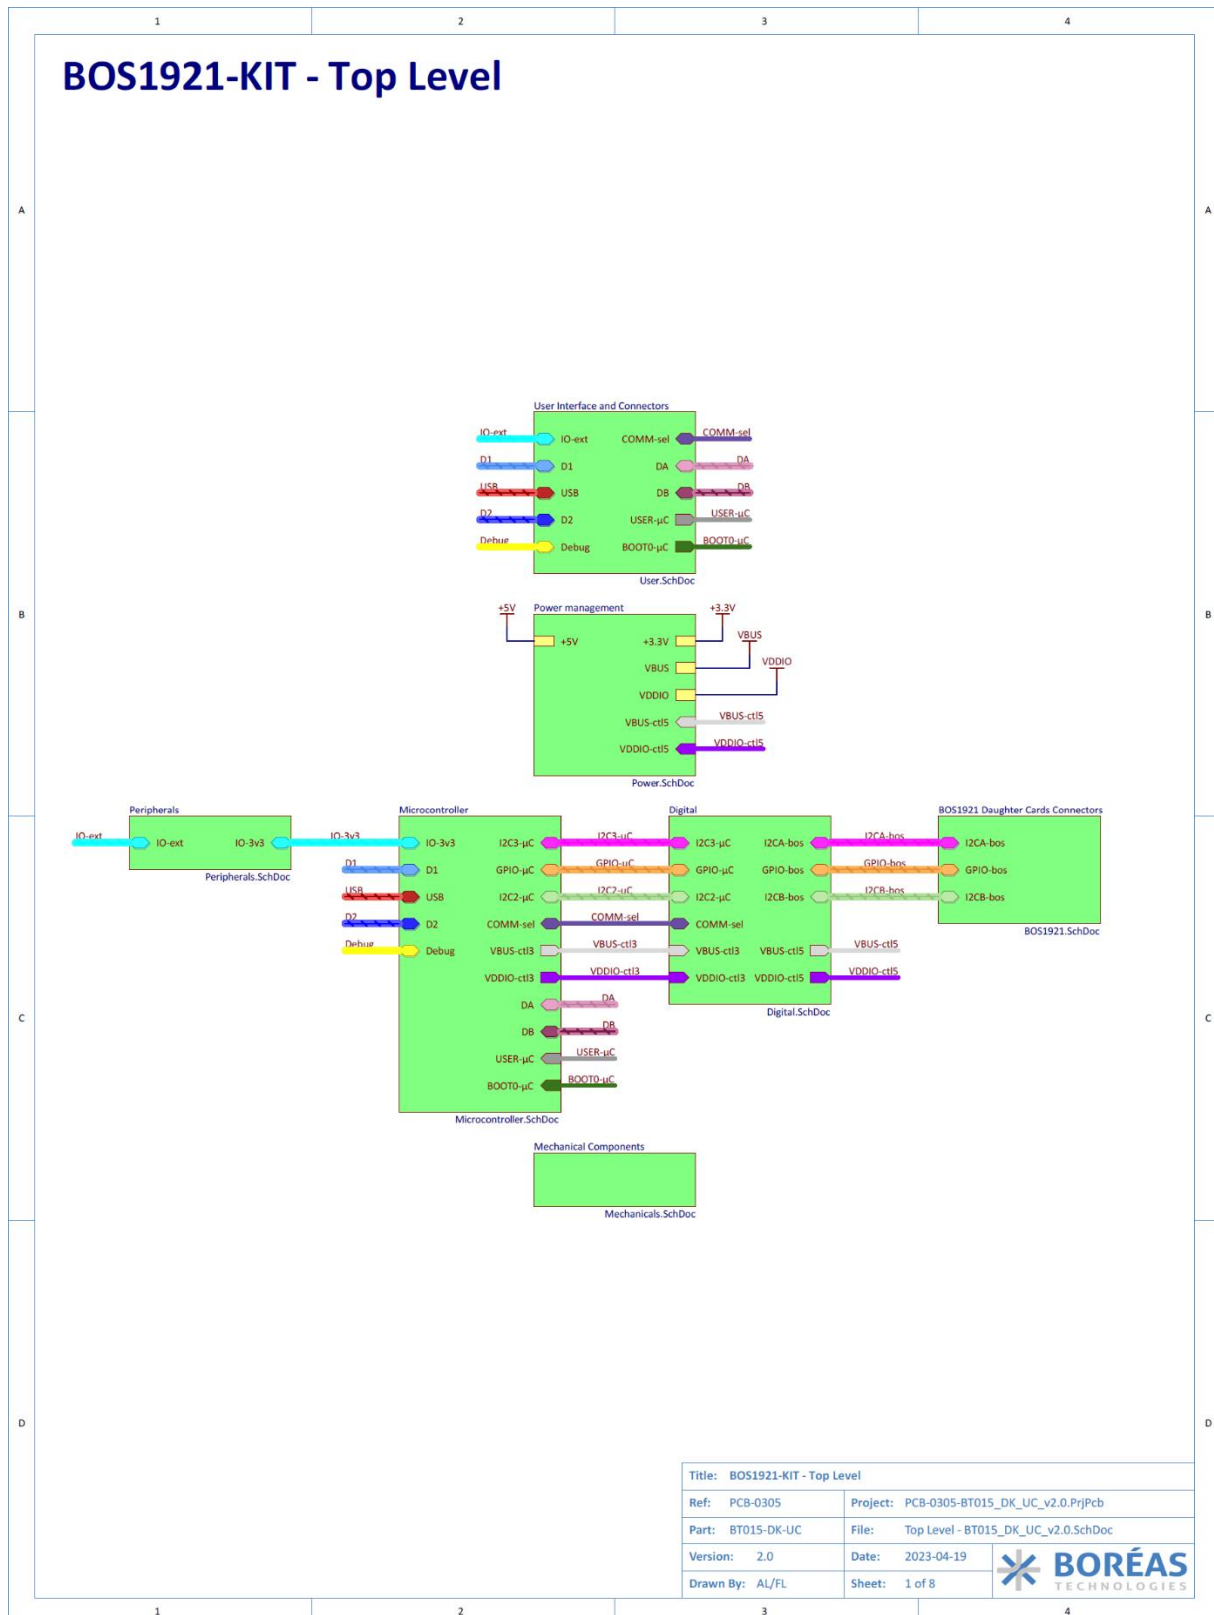

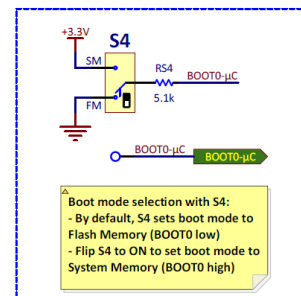

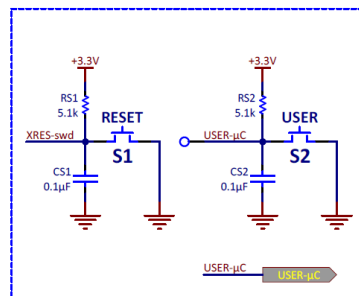

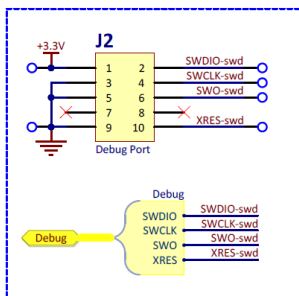

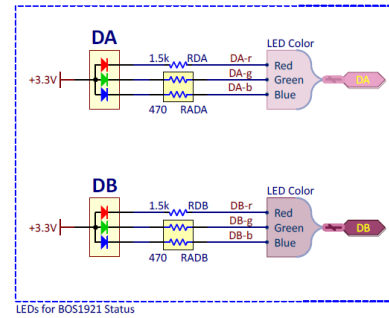

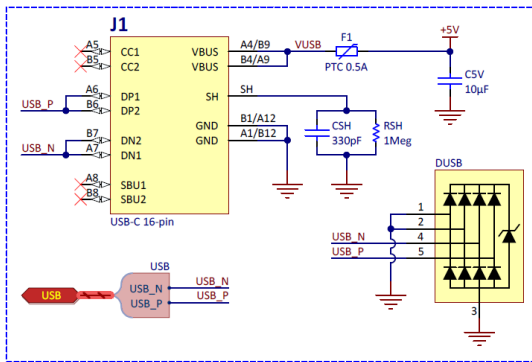

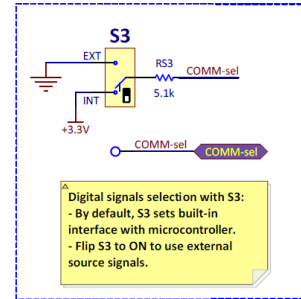

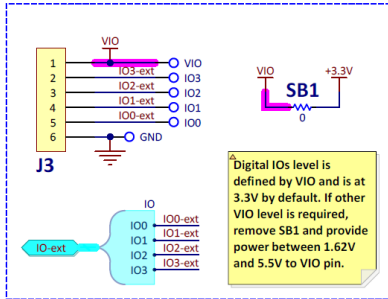

Figure 13: Pump driver board component reconfiguration for direct waveform output

# BOS1921-KIT - Power Management

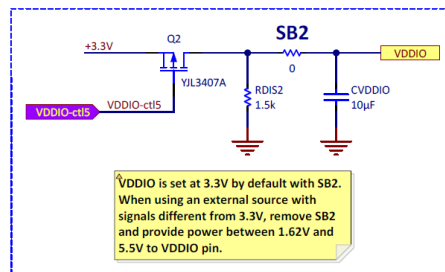

Regulator for 3.3V power

Switch for VBUS

VBUS-ctl5 and VDDIO-ctl5 are at low level by default (with RD31 and RD32 pull-down resistors - refer to Microcontroller page), therefore Q1 and Q2 are pass-through at power up.

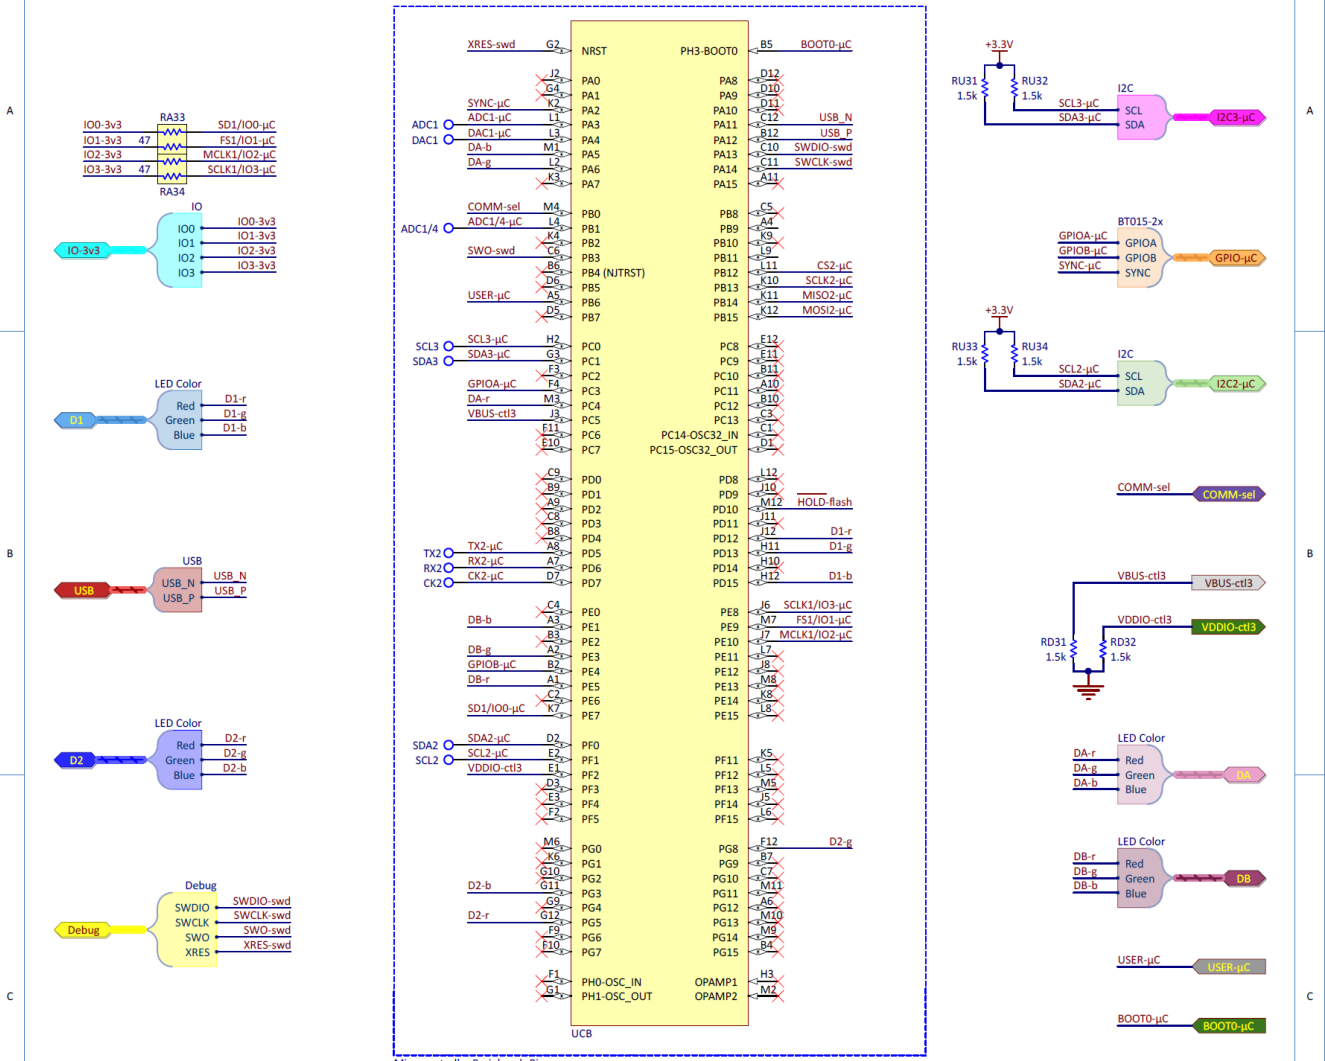

Switch for VDDIO

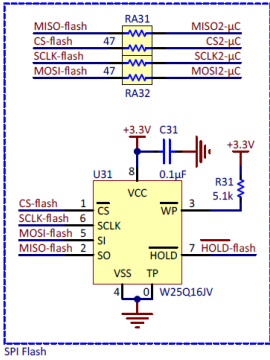

VDDIO is set at 3.3V by default with SB2. When using an external source with signals different from 3.3V, remove SB2 and provide power between 1.62V and 5.5V to VDDIO pin.

### 9.7 Bill of Materials – Controller Board

The following is a list of the components that populate the evaluation PCB. Due to availability, some components with equivalent performance/characteristics may be installed on the actual evaluation PCB. If the exact part number is not available, the components can be replaced by ones with equivalent package and specifications.

Table 12: Bill of Materials for BOS1921-BRD-C01-B1

## 10 FAQ and Troubleshooting

Please refer to Boréas website for FAQ and Troubleshooting information, which will be maintained throughout the BOS1921-KIT lifecycle. It will also contain application note documents that will be helpful for the user writing his/her own code to operate the BOS1921.

## 11 Notice and Warning

### **Danger High Voltage!**

Electric shock possible when connecting board to live wire. Board should be handled with care by a professional. For safety, use of isolated test equipment with overvoltage and/or overcurrent protection is highly recommended.

This product uses semiconductors that can be damaged by electrostatic discharge (ESD). When handling, care must be taken so that the devices are not damaged. Damage due to inappropriate handling is not covered by the warranty.

### **The following precautions must be taken:**

- Do not open the protective conductive packaging until you have read the following and are at an approved anti-static workstation.
- Use a conductive wrist strap attached to a good earth ground.
- If working on a prototyping board, use a soldering iron or station that is marked as ESD-safe.
- Always disconnect the microcontroller from the prototyping board when it is being worked on.
- Always discharge yourself by touching a grounded bare metal surface or approved anti-static mat before picking up an ESD - sensitive electronic component.
- Use an approved anti-static mat to cover your work surface.

### **Oscilloscope measurements:**

Both OUT+ and OUT- are active outputs. When measuring these signals using an oscilloscope, use a separate probe on each output. Never connect the ground of a probe to one of these outputs. Doing so might damage the BOS1921-KIT and/or your oscilloscope. For more information, please consult the *Probing BOS1901 with an Oscilloscope* application note available for download on <https://www.boreas.ca/pages/support>.

## 12 Ordering Information

Table 15: Ordering information

	ORDERING PART NUMBER	DIMENSIONS	PACKING FORMAT	QUANTITY	ACCESSORIES

## 13 Document History

ISSUE	DATE	Document Number	CHANGES
2	October 2023	BT015BUG01.01	Updated boards. Removed GUI section (now self-documented in the application).
1	December 2022	BT015AUG01.01	Original Document.

## Appendix A. Firmware Upgrade using STM32CubeProgrammer

The BOS1921-KIT board supports a standard USB endpoint named "Device firmware upgrade" (DFU). This endpoint is used to transfer firmware to the development kit using the USB port and a DFU transfer software. To advertise the DFU endpoint on the USB port, the BOS1921-KIT board microcontroller needs to execute DFU application in the system memory. The boot selection switch allows to select the system memory.

Figure 24 : Boot selection switch position

### Prerequisites

1. Download STM32CubeProgramme using this [link](#) and follow web page instruction.
2. Install STM32CubeProgrammer.
3. Move the Boot Select switch in System Memory (SM) position.
4. Connect the BOS1921-KIT board to a PC using a USB cable.
5. Start SMT32CubeProgrammer.
6. Reset the BOS1921-KIT board using the RST button.
7. Have the appropriate firmware binary file (.hex) handy. The firmware compatible with the Software are located in the installation directory (C:\Program Files (x86)\Boréas Development Kit\firmware). Older firmware revisions can be downloaded on the [Boréas website](#).

**Procedure**

1. Select *USB* connection mode in the drop box.
2. Refresh the *Port* list using the button:
3. Select *USB1* port in the *Port* drop box. (Note: If more than one development kit are connected on the same PC the *Port* drop box will contains more than one entry. *USB1* may not be the right device.)
4. Click on *Connect* button.

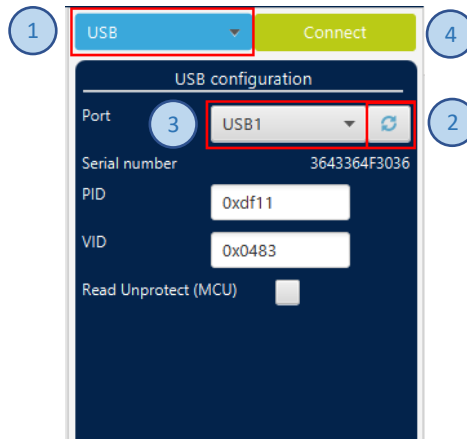

Figure 25: STM32CubeProgrammer connection setting

5. Click on this icon on the left side of the interface to open the *Erase & Programming* panel.
6. Enter the path to the firmware file (.hex) into the *File Path* text field.
7. Check the *Verify programming* checkbox.
8. Click on *Start Programming* button.

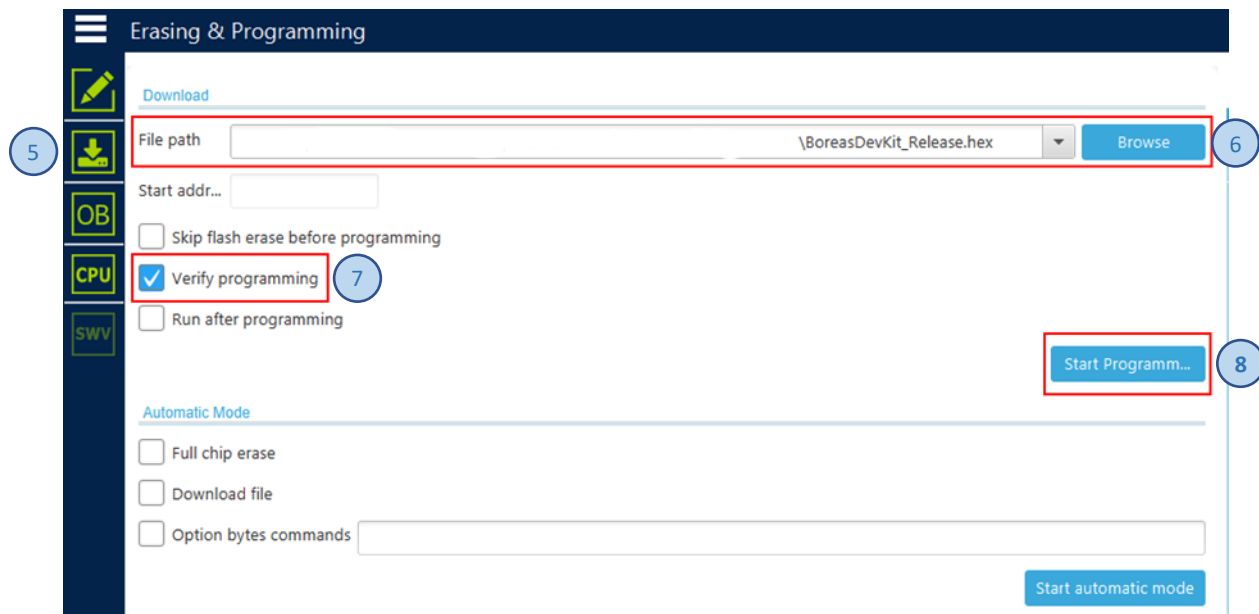

Figure 26: STM32CubeProgrammer programming setting

9. Wait the pop-up message indicating the upgrade completion.

*Figure 27: STM32CubeProgrammer upgrade completed dialog.*

- 10.** Move the Boot Select switch in Flash Memory (FM) position.
- 11.** Reset the development kit using the RST button.

## Appendix B. Audio Mode using Audacity® Software

This appendix explains how Audacity® software can be used to create and play waveforms on the BOS1921-KIT.

### B.1 Software Installation Procedure

Audacity is free of use and can be found at: [link](#)

Please follow the Audacity® installation procedure.

Refer to <https://www.audacityteam.org/about/license/> for the terms of GNU General Public License (GPL) for Audacity® use.

#### dc-offset Plugin Installation (optional)

This plugin will be useful to create waveforms for unipolar piezo actuators or for piezo actuators that have an asymmetrical voltage range (like the TDK piezo supplied with the kit).

1. Download the plugin: [link](#).
2. Install the plugin downloaded using the Nyquist Plug-in Installer.

Figure 28: dc-offset plugin installation

3. Ensure the plugin is enabled.

Figure 29: Access plugin management window

- 4. Select dc-offset in the plugin list and click on *Enable* button, then click on *OK*.

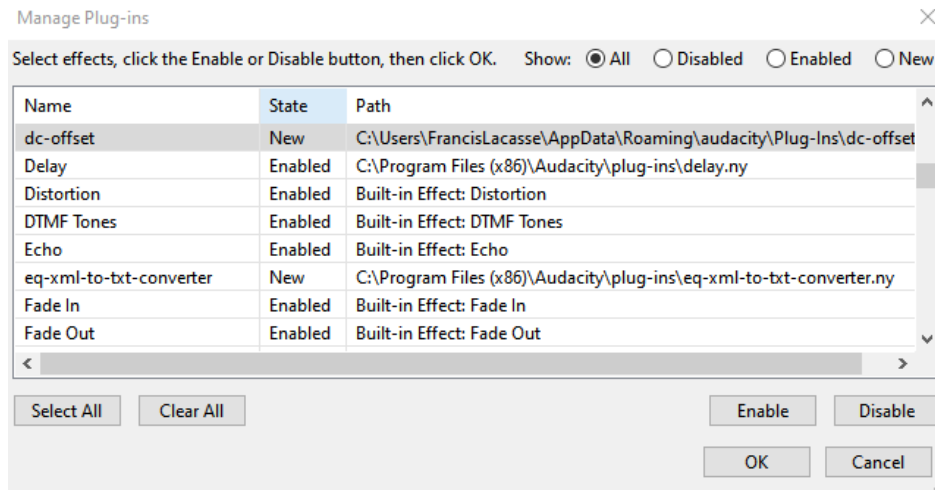

Figure 30: Plugin management window

## B.2 Use Audacity to Play WAV Files

### Description

Download waveform samples from Boréas website and use Audacity® to play them on the BOS1921-KIT.

### Prerequisites

- BOS1921-KIT board is in *Audio* mode.
- Using the BOS1921-KIT software, user has configured the audio limiting settings of the board (see details [here](#))
- Download the waveform examples from the Boréas web site ([link](#))

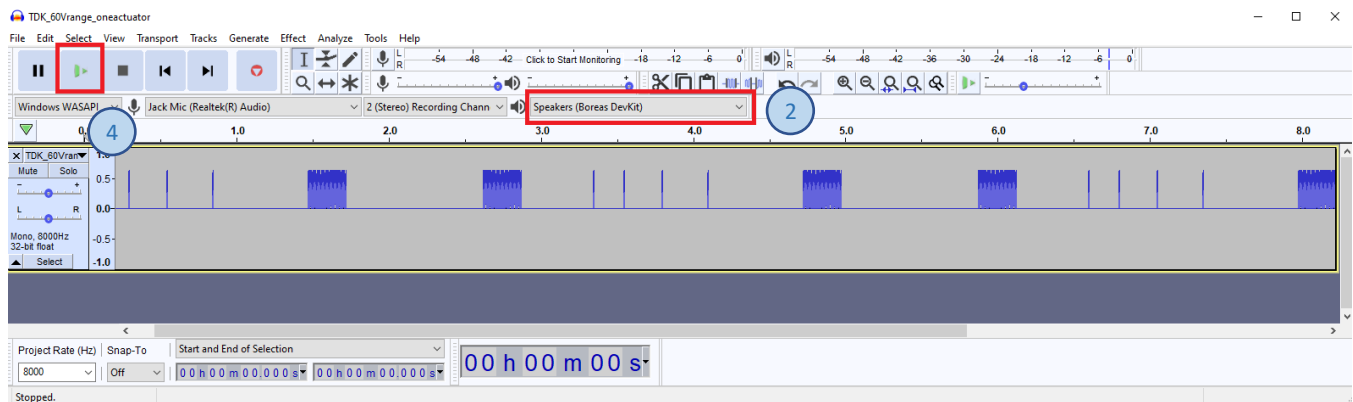

Figure 31: Use audacity to play a WAV file

### Steps

1. Start Audacity software.
2. Select the Speakers (Boreas DevKit) from the playback device selection menu.  
If the Boreas DevKit is not shown in the list, validate that the device kit is in audio mode and that it is connected to the PC. Then from the Audacity menu, click on *Transport / Rescan Audio Devices*.
3. Drag the desired WAV file (Ex: TDK\_60Vrange\_oneactuator.wav) into Audacity to add a new audio track.
4. Press the play button to start playing the waveform on the piezo actuator.

### B.3 Use Audacity and dc-offset Plugin to Create a New Waveform.

#### Description

In this example, we explain how Audacity can be used to create a new sinusoidal waveform in the range of the TDK piezo supplied with the kit (-10 V to 60 V).

In this example the waveform parameters are:

- Amplitude peak to peak = Piezo Vmax – Piezo Vmin = 60 – (-10) = 70 V
- Frequency = 125 Hz
- Duration = 10 sec

#### Prerequisites

- BOS1921-KIT board is in audio mode.
- Audacity and the dc-offset plugin are installed.

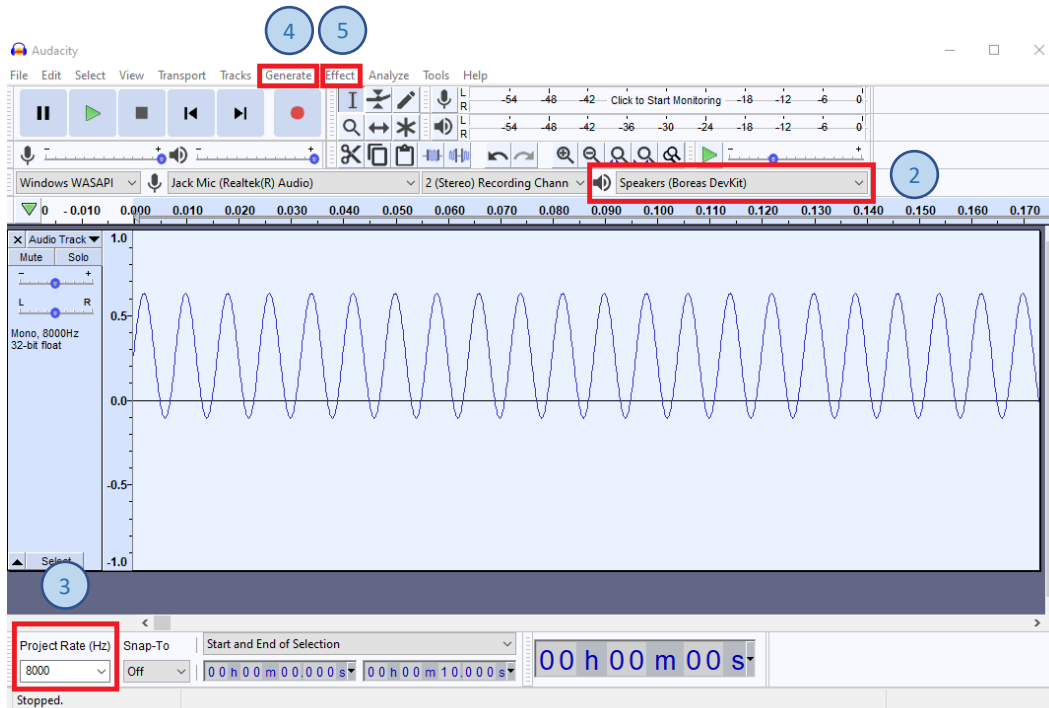

Figure 32: Audacity – simple waveform creation

#### Steps

1. Open Audacity.
2. Select the Speakers (Boreas DevKit) from the playback device selection menu.
3. In the bottom left corner of Audacity, set the project rate to 8000 Hz.
4. In the application menu, select the Option “Generate / Tone”.  
To create the waveform with the parameters mentioned in the description, use the following tone values:

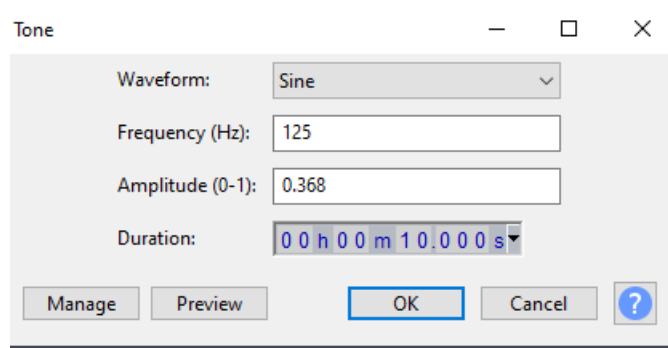

Figure 33: Tone parameters

The amplitude value is calculated with the following formula:

$$\text{Amplitude} = \frac{\text{Peak to Peak Amplitude}}{\text{Boreas IC amplitude max}} \Rightarrow \frac{(60) V - (-10) V}{190 V} \Rightarrow 0.368$$

5. Use dc-offset plugin to offset the signal in the piezo range:

Offset computation:

$$\frac{\text{Piezo } V_{max} + \text{Piezo } V_{min}}{\text{Boreas IC amplitude max}} \Rightarrow \frac{60 V + (-10 V)}{190 V} \Rightarrow 0.263$$

From the application menu, select *Effect / DC offset...* and enter the value calculated above.

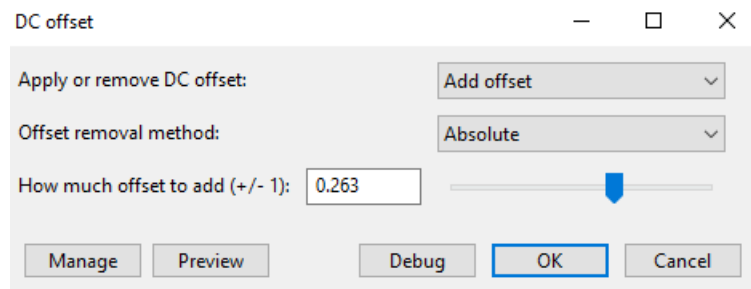

Figure 34: Add dc-offset

6. Play the wave using the play button.
